

BACKLOG

- ☐ Build and automate CI workflow for Retail Order Management Platform
- ☐ Design REST APIs for order and inventory
- ☐ Setup project repository structure
- ☐ Plan CI/CD pipeline
- ☐ Define testing strategy
- ☐ Setup monitoring and logging

FEATURES

- ☐ Order Service API Development
- ☐ Order Status Tracking System
- ☐ Inventory Management API
- ☐ Automated Testing Framework
- ☐ CI Pipeline Implementation
- ☐ Repository Management
- ☐ Application Monitoring
- ☐ Build Validation System

USER STORIES

- ☐ Check order status to know order progress
- ☐ See Inventory availability before placing order

☐ Ensure service reliability using health check API

☐ Automated tests to validate API functionality

☐ CI pipeline automation for continuous integration

☐ Version control to manage code changes efficiently

☐ Monitoring to track application health

TASKS

☐ Create Flask application

☐ Implement /health API endpoint

☐ Implement /order-status API endpoint

☐ Implement /inventory API endpoint

☐ Write pytest test cases for all APIs

☐ Create requirements.txt file

☐ Initialize GitHub repository

☐ Push code to GitHub

☐ Create .github/workflows directory

☐ Add GitHub Actions workflow file

☐ Configure CI pipeline

☐ Run automated tests using pytest

☐ Fix bugs and errors in code

Validate successful pipeline execution

IN PROGRESS

☐ Validate successful pipeline execution

☐ Write test cases

COMPLETED

☐ Create Flask application

☐ Setup GitHub repository

☐ Configure CI pipeline
